Quality of Life by Country: A Clustering Analysis

Katherine M. Prioli

December 22, 2018

Background

Methods

Loading libraries

```
library(tidyverse)
library(readxl)          # For importing .xls(x) datasets
library(lazyeval)        # For renaming columns in function
library(countrycode)     # For establishing uniform country identifiers
library(ggthemr)         # For prettifying output

ggthemr("fresh")
```

Establishing a crosswalk for country names and 3-letter codes

```
countries_full <- codelist_panel %>%
  select(country.name.en, year, genc3c, iso3c, wb_api3c) %>%
  group_by(country.name.en) %>%
  mutate(maxyr = max(year)) %>%
  ungroup %>%
  mutate(maxyr = case_when(
    maxyr == year ~ 1,
    TRUE ~ 0
  )) %>%
  filter(maxyr == 1) %>%
  select(-maxyr) %>%
  distinct()

countries_full <- countries_full %>%
  mutate(country3 = case_when(
    iso3c == genc3c & iso3c == wb_api3c ~ iso3c,
    is.na(iso3c) == FALSE ~ iso3c,
    is.na(iso3c) == TRUE & is.na(genc3c) == FALSE ~ genc3c,
    is.na(iso3c) == TRUE & is.na(genc3c) == TRUE & is.na(wb_api3c) == FALSE ~ wb_api3c
  )) %>%
  rename(country = country.name.en) %>%
  arrange(country)

countries <- countries_full %>%
  select(country, country3)
```

Importing and wrangling each data file, and standardizing country names

Each datafile was imported and wrangled to subset to the variable(s) of interest for 2016. Next, country identifiers in each dataset were compared to the `countries` table, and a `mutate()` statement was used to correct mismatches. In the interest of brevity, these steps are demonstrated for the Human Development Index (HDI) data below.

First, importing and wrangling the HDI data:

```r
# Importing raw data

HDIraw <- read_xlsx("data/HDIdata2018.xlsx", sheet = "Table 2")
HDIraw
```

```
## # A tibble: 240 x 27
##    X__1  `Table 2. Human~ X__2  X__3  X__4  X__5  X__6  X__7  X__8  X__9
##    <chr> <chr>            <chr> <lgl> <chr> <lgl> <chr> <lgl> <chr> <lgl>
##  1 <NA>  <NA>             <NA>  NA    <NA>  NA    <NA>  NA    <NA>  NA
##  2 <NA>  <NA>             Huma~ NA    <NA>  NA    <NA>  NA    <NA>  NA
##  3 HDI ~ Country          Value NA    <NA>  NA    <NA>  NA    <NA>  NA
##  4 <NA>  <NA>             1990  NA    2000  NA    2010  NA    2012  NA
##  5 <NA>  VERY HIGH HUMAN~ <NA>  NA    <NA>  NA    <NA>  NA    <NA>  NA
##  6 1     Norway           0.85~ NA    0.91~ NA    0.94~ NA    0.94~ NA
##  7 2     Switzerland      0.83~ NA    0.88~ NA    0.93~ NA    0.93~ NA
##  8 3     Australia        0.86~ NA    0.89~ NA    0.92~ NA    0.92~ NA
##  9 4     Ireland          0.76~ NA    0.85~ NA    0.90~ NA    0.90~ NA
## 10 5     Germany          0.80~ NA    0.86~ NA    0.92~ NA    0.92~ NA
## # ... with 230 more rows, and 17 more variables: X__10 <chr>, X__11 <lgl>,
## #   X__12 <chr>, X__13 <lgl>, X__14 <chr>, X__15 <lgl>, X__16 <chr>,
## #   X__17 <lgl>, X__18 <chr>, X__19 <chr>, X__20 <chr>, X__21 <lgl>,
## #   X__22 <chr>, X__23 <lgl>, X__24 <chr>, X__25 <lgl>, X__26 <chr>
```

```r
# Selecting columns of interest

HDIdata <- HDIraw %>%
  select(1:2, X__14)

# Assigning sensible column names

HDIcolnm <- c(HDIdata[[3,1]], HDIdata[[3,2]], HDIdata[[4,3]])
colnames(HDIdata) <- HDIcolnm

# Determining boundaries for human development levels in the data
# and using these to create one dataframe for each level

vhhd_st <- which(HDIdata$Country == "VERY HIGH HUMAN DEVELOPMENT") + 1
vhhd_end <- which(HDIdata$Country == "HIGH HUMAN DEVELOPMENT") - 1

hhd_st <- which(HDIdata$Country == "HIGH HUMAN DEVELOPMENT") + 1
hhd_end <- which(HDIdata$Country == "MEDIUM HUMAN DEVELOPMENT") - 1

mhd_st <- which(HDIdata$Country == "MEDIUM HUMAN DEVELOPMENT") + 1
mhd_end <- which(HDIdata$Country == "LOW HUMAN DEVELOPMENT") - 1

lhd_st <- which(HDIdata$Country == "LOW HUMAN DEVELOPMENT") + 1
lhd_end <- which(HDIdata$Country == "OTHER COUNTRIES OR TERRITORIES") - 1

oth_st <- which(HDIdata$Country == "OTHER COUNTRIES OR TERRITORIES") + 1
oth_end <- which(HDIdata$Country == "Human development groups") - 2

HDI_vhhd <- HDIdata %>%
  slice(vhhd_st:vhhd_end) %>%
  mutate(HDI_cat = "Very high")

HDI_hhd <- HDIdata %>%
  slice(hhd_st:hhd_end) %>%
  mutate(HDI_cat = "High")

HDI_mhd <- HDIdata %>%
```

```
  slice(mhd_st:mhd_end) %>%
  mutate(HDI_cat = "Medium")

HDI_lhd <- HDIdata %>%
  slice(lhd_st:lhd_end) %>%
  mutate(HDI_cat = "Low")

HDI_oth <- HDIdata %>%
  slice(oth_st:oth_end) %>%
  mutate(HDI_cat = NA)

# Combining the dataframes into one

HDIdata <- bind_rows(HDI_vhhd, HDI_hhd, HDI_mhd, HDI_lhd, HDI_oth) %>%
  rename(HDIrank = `HDI rank`) %>%
  rename(country = Country) %>%
  rename(HDIindex = `2016`) %>%
  mutate(HDI_cat = factor(HDI_cat, levels = c("Low", "Medium", "High", "Very High"))) %>%
  mutate(HDIrank = case_when(
    HDIrank == ".." ~ as.numeric(NA),
    TRUE ~ as.numeric(HDIrank)
  )) %>%
  mutate(HDIindex = case_when(
    HDIindex == ".." ~ as.numeric(NA),
    TRUE ~ as.numeric(HDIindex)
  ))
HDIdata <- HDIdata[c(2, 1, 3:4)]
```

Next, standardizing country names by using `anti_join()` to see which countries in `HDIdata` don't have a match in the `countries` dataframe, and correcting those for which an inexact match exists:

```
HDIanti <- HDIdata %>%
  anti_join(countries, by = "country") %>%
  select(country) %>%
  arrange(country)
dim(HDIanti)
```

```
## [1] 28  1
```

There are 28 countries in `HDIdata` without an exact match in `countries`. Correcting using `mutate()`:

```
HDIdata <- HDIdata %>%
  mutate(country = case_when(
    country == "Antigua and Barbuda"                    ~ "Antigua & Barbuda",
    country == "Bolivia (Plurinational State of)"       ~ "Bolivia",
    country == "Bosnia and Herzegovina"                 ~ "Bosnia & Herzegovina",
    country == "Brunei Darussalam"                      ~ "Brunei",
    country == "Cabo Verde"                             ~ "Cape Verde",
    country == "Congo"                                  ~ "Congo - Brazzaville",
    country == "Congo (Democratic Republic of the)"     ~ "Congo - Kinshasa",
    country == "Eswatini (Kingdom of)"                  ~ "Swaziland",
    country == "Hong Kong, China (SAR)"                 ~ "Hong Kong SAR China",
    country == "Iran (Islamic Republic of)"             ~ "Iran",
    country == "Korea (Democratic People's Rep. of)"    ~ "North Korea",
    country == "Korea (Republic of)"                    ~ "South Korea",
    country == "Lao People's Democratic Republic"       ~ "Laos",
    country == "Moldova (Republic of)"                  ~ "Moldova",
    country == "Myanmar"                                ~ "Myanmar (Burma)",
    country == "Palestine, State of"                    ~ "Palestinian Territories",
    country == "Russian Federation"                     ~ "Russia",
    country == "Saint Kitts and Nevis"                  ~ "St. Kitts & Nevis",
```

```
    country == "Saint Lucia"                                ~ "St. Lucia",
    country == "Saint Vincent and the Grenadines"           ~ "St. Vincent & Grenadines",
    country == "Syrian Arab Republic"                       ~ "Syria",
    country == "Tanzania (United Republic of)"              ~ "Tanzania",
    country == "The former Yugoslav Republic of Macedonia" ~ "Macedonia",
    country == "Trinidad and Tobago"                        ~ "Trinidad & Tobago",
    country == "Venezuela (Bolivarian Republic of)"         ~ "Venezuela",
    country == "Viet Nam"                                   ~ "Vietnam",
    country == "Côte d'Ivoire"                              ~ as.character(NA),   # UTC-8
    country == "Sao Tome and Principe"                      ~ as.character(NA),   # conflicts
    TRUE                                                    ~ as.character(country)
  )) %>%
  filter(!is.na(country))

HDIanti <- HDIdata %>%
  anti_join(countries, by = "country") %>%
  select(country) %>%
  arrange(country)
dim(HDIanti)
```

```
## [1] 0 1
```

Now there are no countries in `HDIdata` without an exact match in `countries`.

This process of importing, wrangling, and testing against the `countries` dataframe was largely the same for all other datasets of interest, with minor differences depending on the native structure of the data. However, since several of the variables of interest come from OECD, a function was written to import and wrangle them.

```
OECD_wrangle <- function(df, stem){
  stemdata <- df %>%
  select(LOCATION, TIME, Value) %>%
  rename(country3 = LOCATION) %>%
  rename(year = TIME) %>%
  rename(!!stem := Value) # Tidy eval syntax: unquote LHS w/ !!, then := substitute assignment operator
  stemout <- return(stemdata)
}

hoursworkedraw <- read_csv("data/OECD_hoursworked.csv")
incomeineqraw <- read_csv("data/OECD_incomeineq.csv")
infantmortraw <- read_csv("data/OECD_infantmortality.csv")
oophcspendraw <- read_csv("data/OECD_oophcspend.csv")
tertiaryedraw <- read_csv("data/OECD_tertiaryed.csv")

hoursworkeddata <- OECD_wrangle(hoursworkedraw, "hoursworked") %>%
  filter(year == 2016) %>%
  select(-year)

incomeineqdata <- OECD_wrangle(incomeineqraw, "incomeineq") %>%
  filter(year == 2015) %>%
  select(-year)

infantmortdata <- OECD_wrangle(infantmortraw, "infantmort") %>%
  filter(year == 2016) %>%
  select(-year)

oophcspenddata <- OECD_wrangle(oophcspendraw, "oophcspend") %>%
  filter(year == 2016) %>%
  select(-year)

tertiaryeddata <- OECD_wrangle(tertiaryedraw, "tertiaryed") %>%
  filter(year == 2016) %>%
```

```
  select(-year)

OECDjoin <- full_join(hoursworkeddata, incomeineqdata, by = "country3")
OECDjoin <- full_join(OECDjoin, infantmortdata, by = "country3")
OECDjoin <- full_join(OECDjoin, oophcspenddata, by = "country3")
OECDdata <- full_join(OECDjoin, tertiaryeddata, by = "country3")
```

Testing `OECDdata` against `countries` was performed as previously described.

Combining individual data files into one dataframe

All datasets were merged into a single dataframe using serial `join()` statements, and the resulting dataset was filtered to omit countries without data.

```
joindata_1 <- full_join(countries, HDIdata, by = "country")
joindata_2 <- left_join(joindata_1, SPIdata, by = "country3")
joindata_3 <- left_join(joindata_2, WHRdata, by = "country")
joindata_4 <- left_join(joindata_3, genderdata, by = "country")
joindata_5 <- left_join(joindata_4, lifeexpdata, by = "country")
joindata_6 <- left_join(joindata_5, GDPdata, by = "country3")
joindata_7 <- left_join(joindata_6, OECDdata, by = "country3")

# Excluding countries that have no data

joinsub <- joindata_7 %>%
  arrange(country) %>%
  mutate(exclude_flag = case_when(
    is.na(HDIrank) == TRUE &
      is.na(HDIindex) == TRUE &
      is.na(HDI_cat) == TRUE &
      is.na(SPI) == TRUE &
      is.na(happiness) == TRUE &
      is.na(genderequality_index) == TRUE &
      is.na(birth_MF) == TRUE &
      is.na(sixty_MF) == TRUE &
      is.na(GDP_USD_2018) == TRUE &
      is.na(hoursworked) == TRUE &
      is.na(incomeineq) == TRUE &
      is.na(infantmort) == TRUE &
      is.na(oophcspend) == TRUE &
      is.na(tertiaryed) == TRUE              ~ TRUE,
    TRUE                                     ~ FALSE
  )) %>%
  filter(exclude_flag == FALSE) %>%
  select(-exclude_flag)

alldata <- joinsub

# write_csv(alldata, "data/alldata.csv")   # Uncomment if an export is desired

# Removing unneeded files

rm(list = c("joindata_1", "joindata_2", "joindata_3", "joindata_4",
            "joindata_5", "joindata_6", "joindata_7", "joinsub"))
```

The final dataframe, titled `alldata`, contains the following:

Source	Variable Name	Description
The United Nations Development Programme (2018)	HDIrank	HDI ranking
The United Nations Development Programme (2018)	HDIindex	HDI index value (scale of 0:1)
The United Nations Development Programme (2018)	HDI_cat	HDI index category (5 levels)
Social Progress Imperative (2018)	SPI	Social Progress Index value (scale of 0:100)
World Happiness Report (2018)	happiness	World Happiness Score (scale of 0:10)
WEF (2016)	genderequality_index	Gender Equality Index (scale of 0:1)
WHO (2018)	birth_MF	Life expectancy at birth, males & females
WHO (2018)	sixty_MF	Life expectancy at 60 years, males & females
The World Bank (2018)	GDP_USD_2018	2016 Gross Domestic Product (valued in $US 2018)
OECD (2018b)	hoursworked	Hours worked per week
OECD (2018c)	incomeineq	Income inequality
OECD (2018d)	infantmort	Infant mortality rate
OECD (2018a)	oophcspend	Out-of-pocket healthcare spending
OECD (2018e)	tertiaryed	Tertiary education attainment
